Blockchain Data Audit

What is blockchain?

Why are organizations adopting this new technology?

What are the blockchain data audit issues?

Why should you call on Catallaxy's expertise?

Blockchain Data Audit

The use of blockchain is constantly increasing, as this rapidly expanding disruptive technology attracts more and more new clients who want to take advantage of its potential. Many organizations are adopting it for their business needs. Fast and virtually impossible to falsify, it serves to meet one of the main challenges facing entities: data security.

Why audit digital data?

The lack of maturity and regulations surrounding blockchain is undeniably a security issue for organizations adopting this technology.

We have developed services to meet the needs of organizations and their growing interest in this technology in order to support them in their growth.

A blockchain audit not only ensures that the system is secure, effective and resilient, but also analyzes the risk factors and internal controls that the organization should put in place. The audit also makes it possible to verify the information recorded on the blockchain.

Catallaxy's exclusive methodology

Catallaxy, a Raymond Chabot Grant Thornton subsidiary, has developed a unique methodology that is adapted to the infrastructure used (public or private blockchain) to audit a vast range of digital data.

The first step consists in making a complete copy, including the blockchain archives, that is analyzed in its entirety. The blockchain ecosystem, its method of operation and risk factors are reviewed by our team of experts.

The Raymond Chabot Grant Thornton auditors then audit and validate the information recorded on the blockchain using the evidence and a traditional audit approach.
